

BikeEye

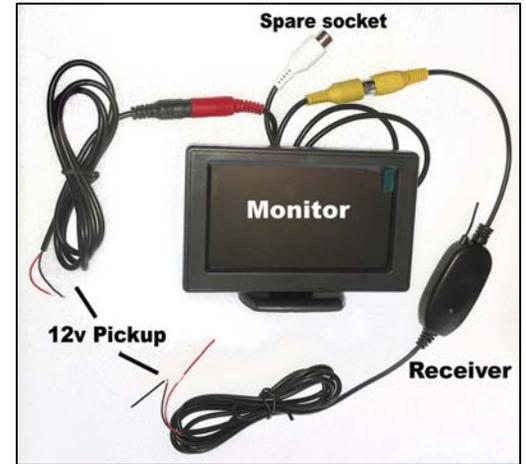

QUICKSTART

The BikeEye rear view camera system is fairly simple to setup as shown in these images. The exact system supplied may vary from the one depicted.

The 12v pickup leads should be wired into your bike at a convenient point (usually the rear light or number plate light for the camera). The red lead is positive.

When the power is on for both devices the transmitter and receiver boxes will show a red light. The picture should then show on the monitor automatically.

The camera is supplied with screw and self adhesive mounting options. The monitor has a self adhesive mount bracket but also included is some double sided Velcro which can be used on the rear of the monitor to enable other fitting locations.
